

# Hipast

*Festulolium*

**Hipast** is a persistent festulolium forage grass and with its comprehensive ground cover, density and softness it will suit grazing and silage making. With its high resistance to rust, snow mold and helminthosporium, Hipast has distanced itself from other festuloliums and will not only suit cold areas with its high winter hardiness but also suit excellent in warm, humid areas afflicted by drought periods and diseases.

## Key Features

- **Very Persistent**
- **High Resistance to Disease**
- **Late Maturity**
- **High Winter Hardiness**
- **Good Grazing Tolerance**

## Yield and Forage Quality

Hipast is a late festulolium and it delivers fast regrowth and increasing yield year after year. It will not only deliver an exceptional high yield but one of the qualities which Hipast possesses, is the high content of digestible matter in combination with a high-energy content.

Official trials reveals a high energy content of average 6.0 NEL20 MJ per kg. dry matter with a protein content up to 12.6 hkg per hectare.
