

CREEPING RED FESCUE

Rosecity

Rosecity - Creeping Red Fescue (IS-FRR 51)

Rosecity is a beautiful strong creeping red fescue resulting from recurrent selections and crosses using plants from persistent older turfs and plants harvested from the Portland, Oregon area containing "Rose City Endophyte". The natural presence of endophyte works to repel surface feeding insects and subsequent vulnerability to stresses and disease, especially red thread. Possessing a dark green color with bright highlights, abundant tillers for increased density and the absence of leaf disease, the inherent beauty of Rosecity is evident in the quality of the turf produced.

Rosecity is best suited for ornamental lawns, golf course roughs and shaded fairways as a component in mixes or blends. Low growing and persistent under minimal management, Rosecity is ideal for low maintenance areas, parks and commercial applications.
